In our next unit of biology, we will study chromosomes and their unique role in inherited traits as well as inheritance patterns in human genetics. We will explore research that led to the discovery of sex determination, sex-linked genes and traits, and linked genes.

The phenotype of an individual is determined by his or her genotype. The genotype is determined by alleles that are received from the individual's parents (one from Mom and one from Dad). These alleles control if a trait is "dominant" or

A few things you should know about genes and inheritance:

Gene - Inside the DNA molecule are sections of information called genes. Each gene tells the cell how to make a certain protein which may determine a trait such as the color of the eyes. **Allele** - While the section of DNA is called a gene, a specific pattern in a gene is called an allele.

Though heredity had been observed for millennia, Gregor Mendel, a scientist and Augustinian friar working in the 19th century, was the first to study genetics scientifically. Mendel studied "trait inheritance", patterns in the way traits are handed down from parents to offspring.
